Install Istio on Azure Kubernetes cluster using Terraform

In this article we will explore how to set-up your kubernetes cluster in Azure and install Istio (service-mesh) using Terraform in a single deployment.

Terminology before we begin-

- Azure Kubernetes Service (AKS) is managed kubernetes cluster as a service from Azure.
- Istio is an open-source service mesh that provides a key set of functionality across the microservices in a Kubernetes cluster.
- Terraform is an open-source tool for building your azure resources using Infrastructure as a code

In this article, you learn how to create/configure resources:

- ✓ Deploy AKS cluster in Azure using terraform
- ✓ Install Istio on AKS using terraform
- ✓ Creating kubernetes secret via terraform
- ✓ Validate Istio installation
- ✓ Access some the add-ons on Istio (like Kiali and Grafana)
- ✓ Install sample application on AKS again using terraform
- ✓ Cleaning-up resources in Azure

Before you begin:

Download and install the Istio `istioctl` client binary, Terraform, Azurecli, Kubernetes Yaml provider (this is optional for installing application in aks)

Create AKS cluster in Azure

The following code snippet create *myAKSCluster* with one node, this will take several minutes, part of the script will create resource group, vnet, subnet, azure ead group for managed identity (you can use service principal instead of azure ead group).

```
1  resource "azurerm_resource_group" "rg" {
2      name      = "aks-resource-group"
3      location = "eastus"
4  }
5
6  resource "azurerm_virtual_network" "vnet" {
7      name            = "aks-vnet"
8      resource_group_name = azurerm_resource_group.rg.name
9      location         = azurerm_resource_group.rg.location
10     address_space    = ["192.168.0.0/16"]
11 }
12
13 resource "azurerm_subnet" "subnet" {
14     name            = "aks-subnet"
15     resource_group_name = azurerm_resource_group.rg.name
16     virtual_network_name = azurerm_virtual_network.vnet.name
17     address_prefixes   = ["192.168.1.0/24"]
18     service_endpoints  = ["Microsoft.ContainerRegistry"]
19 }
20
21 resource "azuread_group" "aks-admin-group" {
22     name = "AKS-Aadmins"
23 }
24
25 resource "azurerm_kubernetes_cluster" "aks" {
26     name            = "myAKSCluster"
27     location         = azurerm_resource_group.rg.location
28     resource_group_name = azurerm_resource_group.rg.name
29     dns_prefix       = "someapplication"
30     default_node_pool {
31         name            = "default"
32         vnet_subnet_id  = azurerm_subnet.subnet.id
33         type            = "VirtualMachineScaleSets"
34         availability_zones = ["1", "2", "3"]
35         enable_auto_scaling = true

kubernetes secret, and install Istio using istioctl. In your console you can see the install will deploy number of CRDs.

Applying manifests for these components:
 - Tracing

- EgressGateway
- NodeAgent
- Grafana
- Policy
- Citadel
- CertManager
- IngressGateway
- Injector
- Prometheus
- PrometheusOperator
- Kiali
- Telemetry
- Galley
- Cni
- Pilot
- Base
- CoreDNS

NodeAgent is waiting on a prerequisite...

Telemetry is waiting on a prerequisite...

Galley is waiting on a prerequisite...

Cni is waiting on a prerequisite...

Grafana is waiting on a prerequisite...

Policy is waiting on a prerequisite...

Citadel is waiting on a prerequisite...

EgressGateway is waiting on a prerequisite...

Tracing is waiting on a prerequisite...

Kiali is waiting on a prerequisite...

PrometheusOperator is waiting on a prerequisite...

IngressGateway is waiting on a prerequisite...

Prometheus is waiting on a prerequisite...

CertManager is waiting on a prerequisite...

Injector is waiting on a prerequisite...

Pilot is waiting on a prerequisite...

Applying manifest for component Base

Waiting for CRDs to be applied.

CRDs applied.

Finished applying manifest for component Base

Prerequisite for Tracing has completed, proceeding with install.

Prerequisite for Injector has completed, proceeding with install.

Prerequisite for Telemetry has completed, proceeding with install.

Prerequisite for Policy has completed, proceeding with install.

Prerequisite for PrometheusOperator has completed, proceeding with install.

Prerequisite for NodeAgent has completed, proceeding with install.

Prerequisite for IngressGateway has completed, proceeding with install.

Prerequisite for Kiali has completed, proceeding with install.

Prerequisite for EgressGateway has completed, proceeding with install.

Prerequisite for Galley has completed, proceeding with install.

Prerequisite for Grafana has completed, proceeding with install.

Prerequisite for Cni has completed, proceeding with install.

Prerequisite for Citadel has completed, proceeding with install.

Applying manifest for component Tracing

Prerequisite for Prometheus has completed, proceeding with install.

```

Prerequisite for Pilot has completed, proceeding with install.
Prerequisite for CertManager has completed, proceeding with install.

Finished applying manifest for component Grafana
Finished applying manifest for component Telemetry

```

Component IngressGateway installed successfully:

=====

```

serviceaccount/istio-ingressgateway-service-account created
deployment.apps/istio-ingressgateway created
gateway.networking.istio.io/ingressgateway created
sidecar.networking.istio.io/default created
poddisruptionbudget.policy/ingressgateway created
horizontalpodautoscaler.autoscaling/istio-ingressgateway created
service/istio-ingressgateway created

```

...

If you can see above CRD's installation in your console window means you have successfully deployed Istio to your AKS cluster. Let's move on to validate our Istio installation and access Kiali and Grafana dashboards.

Verify a successful Istio installation

You can check if the Istio installation succeeded using the `verify-install` command which compares the installation on your cluster to a manifest you specify.

```
$ istioctl verify-install -f istio-aks.yaml
```

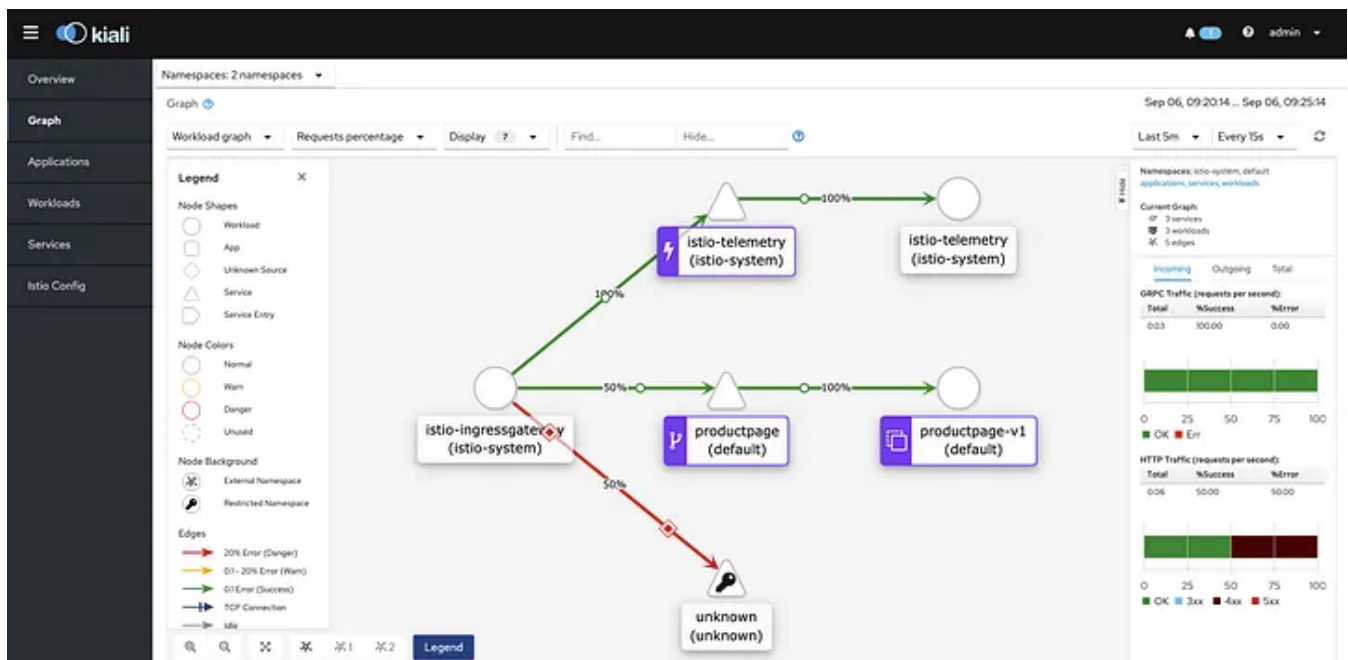

Access Kiali Dashboard

A service mesh observability dashboard is provided by kiali. First get the credentials from your cluster. To get credentials run the below code.

```
$ kubectl get secrets/kiali -n istio-system --template={{.data.passphrase}} | base64 -D
```

Then use the username 'admin' and password from the above output to access Kiali dashboard. To open the Kiali dashboard securely as follows:

```
$ istioctl dashboard kiali
```

sample kiali dashboard

Access Grafana Dashboard

The analytics and monitoring dashboards for Istio are provided by Grafana. First get the credentials from your cluster. To get credentials run the below code.

```
$ kubectl get secrets/grafana -n istio-system --template={{.data.passphrase}} | base64 -D
```

Then use the username 'admin' and password from the above output to access Grafana dashboard. To open the Grafana dashboard securely as follows:

```
$ istioctl dashboard grafana
```

Some other dashboards that are installed as part of our manifest file.

Jaeger for tracing

```
$ istioctl dashboard jaeger
```

Open in app ↗

Sign up

Sign In

```
$ istioctl dashboard prometheus
```

Cleanup resources

To clean-up all the resources you have created run

```
$ terraform destroy -auto-approve
```

Closing Remarks 🎉

I hope this article will help you with creating AKS cluster and setting-up Istio via manifest. Please feel free to share your feedback and experience in the comments section.
